CLAIMS

-1-

(Original) A control system for controlling automated applications in a building environment comprising:

a communications network;

a plurality of application controllers connected to said communications network, each of said application controllers including means for controlling operation of a corresponding automated device, each of said application controllers including a controller type;

a control interface connected to said communications network, said control interface including a database of at least one profile for an application controller type; and

self-configuration means for providing automated configuration of each of said application controllers on said network, said self-configuration means including means for conveying said controller type of said application controller from said application controller to said control interface, said self-configuration means further including means for configuring said application controller based on said profile corresponding to said controller type of said application controller.

-2-

(Original) The control system of claim 1 wherein each of said application controllers controls operation of said corresponding automated device in accordance with at least one variable; and

Applicants: Christopher Kikta et al.
Serial No.: 10/044,036
Page 3 of 11

wherein said control interface includes means for controlling operation of said application controller by specifying a value of said variable.

-3-

(Original) The control system of claim 2 wherein said database of at least one profile for a controller type is further defined as including a plurality of profiles for application controllers of different controller types.

-4-

(Original) The control system of claim 3 wherein said control interface includes means for transmitting explicit messages to said application controllers, each of said explicit messages including an identification unique to a specific one of said application controllers; and said application controllers each including means for receiving said explicit messages from said control interface, said means for receiving including means for recognizing only those of said explicit messages which include an identification unique to said application controller in which said means for receiving resides.

-5-

(Original) The control system of claim 4 wherein said means for transmitting explicit messages include means for incorporating said value of said variable into said explicit message.

-6-

(Original) The control system of claim 5 wherein said database of profiles includes input, output and configuration data structures for said application controllers.

Applicants: Christopher Kikta et al.
Serial No.: 10/044,036
Page 4 of 11

-7-

(Original) The control system of claim 6 wherein each of said application controllers include an occupancy status;

 said control interface including means for grouping a plurality of application controllers into an occupancy group; and

 means for defining said occupancy status of each of said application controllers in a given occupancy group as a group.

-8-

(Original) The control system of claim 7 further comprising a network server interface, said network server interface including means for monitoring and controlling operation of said control system over an Internet connection.

-9-

(Original) The control system of claim 4 wherein said control interface includes means for monitoring a status of each of said application controllers, said means for monitoring including a means for periodically transmitting a ping to each of said application controllers and a means for receiving a response to said ping from each of said application controllers.

-10-

(Original) The control system of claim 9 wherein each of said application controllers includes a means for receiving said ping from said control interface and a means for transmitting a response to said ping to said control interface.

Applicants: Christopher Kikta et al.
Serial No.: 10/044,036
Page 5 of 11

-11-

(Original) The control system of claim 4 wherein said plurality of application controllers includes at least one HVAC application controller, at least one lighting application controller and at least one access control application.

-12-

(Original) The control system of claim 4 wherein said local control interface further includes:

a database of application controller control software images; and
means for downloading said control software images into at least one of said application controllers.

-13-

(Original) The control system of claim 12 further comprising means for downloading said application controller control software images into said local control interface from an external source, whereby said application controller control software images can be upgraded.

-14-

(Original) The control system of claim 13 wherein at least one of said application controllers is preprogrammed with basic networking and configuration software enabling said at least one application controller to receive and install said application controller control software images downloaded by said local control interface.

Applicants: Christopher Kikta et al.
Serial No.: 10/044,036
Page 6 of 11

-15-

(Original) The control system of claim 4 wherein said local control interface further includes means for downloading a local control interface control software image into said local control interface.

-16-

(Original) The control system of claim 15 further comprising means for downloading said local control interface control software image into said local control interface from an external source, whereby said local control interface control software images can be upgraded.

-17-

(Original) The control system of claim 16 wherein at least one of said local control interface is preprogrammed with basic networking and configuration software enabling said local control interface to receive and install said local control interface control software image downloaded by said local control interface.

-18-

(Original) The control system of claim 4 wherein at least one of said local control interface and said application controllers is preprogrammed with a generic programming language and includes means for downloading a control program to be run by said programming language to define operation of at least one of said local control interface and said application controllers.

-19-

(Original) A control system for automated applications in a building environment comprising:

a communications network;

a plurality of application controllers connected to said network, each of said application controllers providing automated operation of a corresponding application, each of said application controllers being capable of providing automated operation of said corresponding application in accordance with a plurality of control variables; and

a control interface connected to said network, said control interface including means for transmitting explicit messages to each of said application controllers, said explicit messages including commands for adjusting said control variables of said application controller;

wherein each of said application controllers includes means for processing said commands received from said control interface in said explicit messages and means for adjusting a value of said control variables in accordance with said command, whereby said control interface is capable of controlling operation of said application controllers.

-20-

(Original) The system of claim 19 wherein said application controllers include application controllers of a plurality of different controller types;

said control interface including a preprogrammed database containing at least one profile, said profile defining said control variables for said one of said controller types.

Applicants: Christopher Kikta et al.
Serial No.: 10/044,036
Page 8 of 11

-21-

(Original) The system of claim 20 wherein said preprogrammed database containing a plurality of profiles, each of said profiles being uniquely associated with one of said controller types and defining said control variables for said one of said controller types.

-22-

(Original) The system of claim 20 wherein said controller types include at least an HVAC controller type, a lighting controller type and an access controller type.

-23-

(Original) The system of claim 22 further comprising a network server interface, said network server interface including means for monitoring and controlling operation of said control system over an Internet connection.

-24-

(Original) The system of claim 23 wherein said control interface includes a means for periodically transmitting a ping to each of said application controllers and a means for receiving a response to said ping from each of said application controllers.

-25-

(Original) The system of claim 24 wherein each of said application controllers includes a means for receiving said ping from said control interface and a means for transmitting a response to said ping to said control interface.

Applicants: Christopher Kikta et al.
Serial No.: 10/044,036
Page 9 of 11

-26-

(Original) The system of claim 25 wherein said ping for at least one of said application controllers includes data for updating said application controller with current system information, said application controller including means for updating certain of said control variables in accordance with said current system information.

-27-

(Original) The system of claim 26 wherein said response transmitted by at least one of said application controllers includes data relevant to at least one other of said application controllers, said control interface including means for transmitting said data included in said response to said other of said application controllers.

-28-

(Original) The system of claim 27 wherein said control interface includes means for generating an alarm if any of said application controllers fails to respond to said ping.

-29-

(Original) The system of claim 28 further comprising self-configuration means for providing automated configuration of each of said application controllers on said network, said self-configuration means including means for conveying said controller type of said application controller from said application controller to said control interface, said self-configuration means further including means for configuring said application controller based on said profile corresponding to said controller type of said application controller.

-30-

Applicants: Christopher Kikta et al.
Serial No.: 10/044,036
Page 10 of 11

(Original) The system of claim 29 wherein each of said application controllers includes an occupancy status;

 said interface controller including a means for grouping said application controllers into occupancy groups; and

 said interface controller further including means for defining as a group said occupancy status of each of said application controller is a given group.

-31-

(Original) The system of claim 30 wherein said control interface includes:

 means for calculating a person count for at least one of said groups based on access entry and access exit information received by said control interface from an access control unit;

 means for defining said occupancy status of said controllers within said group based on said person count.

Claims 32-66 (Cancelled)
